GAIN INSIGHTS ON YOUR CYBER SECURITY POSTURE

SECURING HYBRID AND MULTI-CLOUD PLATFORMS

As more businesses extend outside the data centre and consume services in the cloud, their risk exposure increases with the growing threat surface. Whether you adopt a hybrid or multi-cloud strategy, we understand how difficult it can be to secure your environment without visibility across all hosts and services.

Domain Name Based Assessment

CSI is partnering with Ignition Technology to perform a domain name based assessment of your security threats using the 'Catalyst Insights' tool and will provide you with a report of the findings.

With experience operating and securing private, hybrid or multi-cloud environments, CSI can guide you through the results of the assessment and provide recommendations on how to reduce your risk exposure.

Gain Visibility of Cyber Vulnerabilities

With cloud often extending the security attack perimeter, Catalyst Insights operates in a private, hybrid or multicloud environments.

It improves your security posture by connecting and amalgamating numerous sources of critical security and intelligence data into one simple, navigable pane of glass.

By increasing the visibility of risks and vulnerabilities across all hosts and servers, we can help future-proof your organisation from cybersecurity threats.

24x7 Security Operations Centre

At CSI we believe that Security Operations should be focused on one thing and one thing only – the identification of potentially malicious activity within customer environments.

Our highly skilled Security Operations Centre (SOC) Analysts focus their time and energy on finding indications of threat or compromise (IOT/IOC) through a combination of extensive cyber knowledge, years of experience and significant investment in our technology platforms.

You can rest assured with CSI you are in safe hands.

Collect and correlate breach data

Catalyst Insights takes several sources of breach data intelligence about a company and displays in a simple drill-down interface.

It crosschecks the data against the top 1,000 most used passwords. A simple script can correlate the data against your company's Active Directory data to see which users need to change their passwords urgently (due to a recent breach).
