

CYBER

SIEM AS A SERVICE

Seamless SIEM.

Security Information and Event Management (SIEM) is a critical component of any organisation's security strategy. However, all too often, resource restraints mean the full functionality and benefit of SIEM technologies goes unused, increasing vulnerability to threat.

CSI's SIEM as a Service enables you to reduce both threat and cost by providing a full range of unified threat management solutions, operated from our 24-hour Cyber Security Centre and delivered as a managed IT service.

CYBER SECURITY CENTRE

Businesses increasingly need to do more with less and hackers exploit this fact. An effective Cyber Security Centre can form the core of your defence against advanced cyber attacks. However, when developed in-house, challenges include identifying suitably skilled resources to provide 24x7 coverage and leveraging the most effective technologies for advanced threat detection and reporting metrics.

CSI's Cyber Security Centre allows you to deliver comprehensive threat protection without committing to the associated investment in your own cyber security team. Our certified multi-discipline experts not only identify events, they provide the analysis needed for you to understand what they mean and how best to respond to threats before they impact your enterprise.

CYBER SECURITY FOR INFRASTRUCTURE

Cyber attacks against high-profile organisations attract headlines, but any business can be a target for cyber-criminals, competitors or disgruntled ex-employees. Cyber attacks can affect firewalls, endpoints, databases, file systems, active directories, email and web servers, and network devices.

IT security products alone cannot deliver adequate threat protection. That's why CSI integrates cutting-edge cyber software with comprehensive managed services.

By maintaining a broad portfolio of vendor relationships and ongoing certifications across key technology areas CSI delivers technical and management solutions that are consistent with best practice, customer policies and risk profile.

"Improve SIEM Satisfaction."

- 54% of respondents agree that their SIEM implementation generates too many low level alerts
- 70% want fewer alerts that are more accurate and prioritised
- 68% said that SIEM would be more useful if they had additional staff

Survey by Ponemon Institute

ACCESS AND IDENTITY MANAGEMENT

A fundamental cyber security discipline is to enable the right individuals to access the right resources at the right times for the right reasons – and nothing more.

With the increase in remote working, misuse of identity and access has become one of the most prevalent security challenges faced by businesses. Response is critical but excessive controls can disrupt normal business operations.

CSI's Access and Identity Management solutions and services have been developed to prevent exploitation of access control and identity management while ensuring that your organisation continues to operate efficiently.

YOUR PERPETUAL EDGE

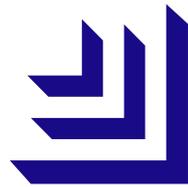

TECHNOLOGY IS THE MEANS. OUTCOMES ARE THE END.

The world cares less and less about the specific IT and more and more about what it can do.
That's why we take a technology-neutral, outcomes-biased approach.

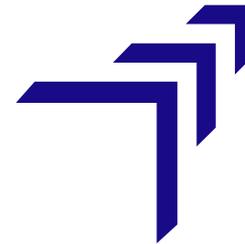

GROW

Our expertise in securely optimising digital performance means that whether you need to enhance app performance, harness emerging technology or liberate talent to focus on innovation, we can enable you to create customer experiences that drive next-level satisfaction, loyalty and growth.

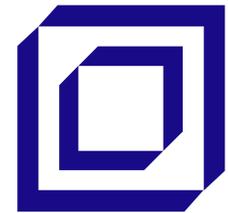

SAVE

Against a cost-conscious backdrop CSI delivers critical compute 'on-demand' and provides an opex financial model for data and applications. It means your capital can be refocused on value creation and your business can obtain and sustain a cost advantage.

INNOVATE

Whether it's translating workload data into business intelligence, creating future-proof architecture or enabling your business to delegate resource-hungry core IT, CSI can help you find and exploit a perpetual edge.

PROTECT

At CSI, we employ our expertise to identify weaknesses before cyber criminals do and we deploy machine learning to reduce zero-day threat to as close to zero threat as possible.
