Discover the future of IBM i backups - today.

INVEST & SCALE WITHOUT COST BARRIERS.

Any business that depends on physical media today will have routine costs that compound over time. This means, after years of buying tape in volume, your business could have substantial spend tied up in media just sitting in cold storage.

Make your investment into a virtual tape solution a lasting one. Our PowerVT appliance decreases the on-going costs for data retention whilst phasing out the cost of buying and managing physical tapes.

What does scalability and efficiency look like in a single appliance? CSI's Power VT has the capability to build multiple tape drives with performance gains.

MODERNISED BACKUP FOR TRUSTED IBM i PLATFORMS.

Today's huge data volumes can create an expensive challenge for businesses who backup to tape across large environments. Take the pressure off limited backup windows and avoid the cost of procuring, managing, transporting and storing tape. PowerVT is a modernised backup engine that uses IBM Power System base to offer a cost-effective, flexible alternative to traditional tape backup.

With lower operational costs, enhanced recoverability, and using market-leading technologies, PowerVT is the IBM i backup solution of choice for global brands, including major telco providers, banks and all other verticles.

WHAT'S YOUR CLOUD AMBITION?

PowerVT is a vendor-aligned solution that also removes the technical headache in getting to the cloud. Simplify the migration of on-premises IBM Power workloads to PowerVS in the IBM Cloud. It's non-disruptive and potentially more efficient than competitive solutions when it comes to data migration.

For simplified migration to the cloud, and superior reliability to physical tape, PowerVT is **the ideal replacement for Dell Data Domain** and a product of choice for modernised businesses.

LET'S TALK ABOUT THE BENEFITS.

- ✓ One UK bank with a significant national customer base benefitted from a footprint reduction down from seven racks spaces of physical tape drives to only half a rack of virtual tape whilst enjoying data deduplication rates at 25:1.
- ✓ Avoid repeating investments when your tape library goes End-of-Life/ EoL (e.g. TS3500 and earlier).
- ✓ Zero capacity increases unless you take on new workloads, demands, or development environments.
- ✓ Get **predictable costs** for backup into the future.
- ✓ Every business wants enhanced recoverability. It's faster and easier to restore backed up copies via PowerVT, improving recovery time objectives to hours NOT weeks.
